J. Properties. Forms voltage-dependent, ion-permeable channels in membranes. At high concentration causes cell membrane lysis. Shown to be 5-10 times more toxic, cytolytic and active in membrane pore

In aqueous solution exists as a tetramer.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the pardaxin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ;

```

```
(By similarity).
-!- SUBCELLULAR LOCATION: SOLUBLE, MICROSOMAL AND CELL WALL FRACTIONS.
-!- TISSUE SPECIFICITY: Roots and coleoptile. In roots, present in the mature region, but not in the tip. Not detected in leaves.
-!- INDUCTION: Increased by salt stress in roots and decreased by salt stress in coleoptile.
                                                                                                                                                                                                                                                                                                                                                                                                   -!- FUNCTION: May play a role in altering the properties of cell walls during germinative growth.
-!- SUBUNIT: Oligomer (believed to be a pentamer but probably hexamer)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TISSUE=Skin secretion;

-!- FUNCTION: May play a role in altering the properties of cell walls during germinative growth.

-!- SUBUNIT: Oligomer (believed to be a pentamer but probably hexamer) (By similarity).

-!- SUBCELLULAR LOCATION: SOLUBLE, MICROSOMAL AND CELL WALL FRACTIONS.

-!- TISSUE SPECIFICITY: Roots and coleoptile. In roots, present in the mature region, but not in the tip. Not detected in leaves.

-!- INDUCTION: Increased by salt stress in roots and decreased by salt stress in coleoptile.

Spermatophyta, Magnoliophyta, Liliopsida, Poales, Poaceae, Pooideae,
        -!- FUNCTION: Hypotensive neuropeptide (Probable).
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Skin dorsal glands.
-!- PTM: Isoform 3.2Y4 differs from isoform 3.2 in not being sulfated.
-!- MASS SPECTROMETRY: MW=1423; METHOD=Electrospray.
-!- SIMILARITY: Belongs to the gastrin/cholecystokinin family.

"Distinct sequence of gonadotropin-releasing hormone (GnRH) in dogfish brain provides insight into GnRH evolution.";

Proc. Natl. Acad. Sci. U.S.A. 89:6373-6377(1992).

-!- FUNCTION: Stimulates the secretion of gonadotropins.

C.!- SUBCELLULAR LOCATION: Secreted.

C.!- SIMILARITY: Belongs to the GnRH family.

Eur. J. Biochem. 250:727-734(1997).
-!- FUNCTION: May act as a neurotransmitter or neuromodulator.
-!- SIMILARITY: Belongs to the allatostatin family.
Neuropeptide; Amidation; Multigene family.
MOD RES
9 AMIDATION.
SEQÜENCE 9 AA; 927 MW; 832D79CDCB46DR61 CPC64.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          aggregation.
SUBUNIT: HEXAMER CONTAINING 2 SETS OF 3 NONIDENTICAL CHAINS
(ALPHA, BETA AND GAMMA), LINKED TO EACH OTHER BY DISULFIDE BONDS.
PTM: Conversion of fibrinogen to fibrin is triggered by thrombin, which cleaves fibrinopeptides A and B from alpha and beta chains, and thus exposes the N-terminal polymerization sites responsible for the formation of the soft clot.
                                                                                                                                                                                                                                                                                                                                                          Gaps

Jaffe H., Raina A.K., Riley C.T., Fraser B.A., Nachman R.J.,
Vogel V.W., Zhang Y.-S., Hayes D.K.;

"Primary structure of two neuropeptide hormones with adipokinetic and
hypotrehalosemic activity isolated from the corpora cardiaca of horse
flies (Diptera).";

L. Proc. Natl. Acad. Sci. U.S.A. 86:8161-8164(1989).

C. -: FUNCTION: This hormone, released from cells in the corpora
cardiaca after the beginning of flight, causes release of
diglycerides from the fat body and then stimulates the flight
muscles to use these diglycerides as an energy source.

C. -: SUBCELLULAR LOCATION: Secreted.

C. -: SUBCELLULAR LOCATION: Secreted.

C. -: SUBCELLULAR LOCATION: Sereted.

C. -: SUBCELLULAR LOCATION: Flight, Pyrrolidone carboxylic acid.

ROSITE: PSO0256; AKH: 1.

-!- FUNCTION: This hormone, released from cells in the corpora
-!- FUNCTION: This hormone, released from cells in the corpora
cardiaca after the beginning of flight, causes release of
diglycerides from the fat body and then stimulates the flight
muscles to use these diglycerides as an energy source.

"Primary structure of two neuropeptide hormones with adipokinetic and
hypotrehalosemic activity isolated from the corpora cardiaca of horse
flies (Diptera).";
flies (Diptera).";
From The Card. Sci. U.S.A. 86:8161-8164(1989).
-!- FUNCTION: Hypertrehaloseemic factors are neuropeptides that
elevate the level of trehalose in the hemolymph (trehalose is the
major carbohydrate in the hemolymph of insects).
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the AKH / HRTH / RPCH family.

"Characterization of a dynamic S layer on Bacillus thuringiensis.";
J. Bacteriol. 171:6656-6667(1989).
-!- FUNCTION: The S-layer is a paracrystalline mono-layered assembly of proteins which coat the surface of bacteria.
-!- SUBCELLULAR LOCATION: CELL WALL. THIS BACTERIUM IS COVERED BY A S-LAYER WITH OBLIQUE (P2) SYMMETRY.
PIR; A60476; A60476.
Cell wall; S-layer.

                                         "Sialokinin I and II: vasodilatory tachykinins from the yellow fever mosquito Aedes aegypti.";
Proc. Natl. Acad. Sci. U.S.A. 91:138-142(1994).
-!- FUNCTION: Vasodilatory peptide. May activate macrophages at the site of feeding.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Belongs to the tachykinin family.
                                                                                                                                                                                                                        Gaps

-!- FUNCTION: Causes hyperactivity in mice.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed by the venom duct.
-!- MASS SPECTROMETRY: MW=1454.8; METHOD=Electrospray.
-!- SIMILARITY: Belongs to the FARP (FMRFamide related peptide)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ٦;

Argiolas A., Pisano J.J.;

"Isolation and characterization of two new peptides, mastoparan C and crabrolin, from the venom of the European hornet, Vespa crabro.";
J. Biol. Chem. 259:10106-10111(1984).

-!- FUNCTION: Mast cell degranulating peptide. Activates G proteins that couple to phospholipase C.

PIR; A01779; QMVHP2.

Mast cell degranulation; Amidation.
